

Database Design and Development Final Project

Phase 1: Requirements Gathering

Molly Moser

My relational database system is going to be for a horse barn and riding lesson tracker. In my spare time, I work at a summer camp and lesson barn, and we are SO disorganized. My thought is that this project would be something that the barn would actually be able to use at some point down the line. I want to be able to see what horses we have and what their status is, track our lessons and students, and track other barn maintenance and staff needs.

I have three categories of target users:

1. Barn Director and Head Wrangler – These two positions need to be able to see EVERYTHING. They're the bosses
2. Staff – The staff need to be able to see the lesson schedule, horse and student records, etc.
3. Students – Students need to have their schedules available to them

I need to be able to track my horses, students, staff, lessons, medical records, and barn needs/maintenance

Use Cases:

Use-Case-01: Book a lesson. A student needs to be able to book a lesson.

Use-Case-02: View health information. Staff need to be able to see which horses have received medical care, and what type of care it was.

Use-Case-03: Assign barn maintenance tasks. The barn director needs to be able to assign specific barn tasks to specific staff.

Use-Case-04: View students, staff, and horses. The barn director needs to be able to see all their staff, students, and horses in the database.
